Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/671,671	Applicant(s) KNEBEL ET AL.	
	Examiner Michael E. Keefer	Art Unit 2154	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 14 May 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-9 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-9 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This Office Action is responsive to the Amendment filed 5/14/2007.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1 and 5 are rejected under 35 U.S.C. 102(e) as being anticipated by Dang et al. (US 2003/0189896), hereafter Dang.

Regarding claim 1, Dang discloses:

A method of re-configuring a network element of a transmission network to restore traffic after a failure, said method comprising the steps of:

generating a configuration request to implement a new cross-connection through said network element ([0032] describes how the head node might receive a generated request to repair a broken network path (i.e. a configuration request), which means that the request inherently was generated in order to be received.)

performing said request in a first fetch-ahead phase comprising only configuration steps essential for fast implementation of said cross-connection and skipping security related configuration steps thereby providing reduced

security against process restarts ([0034] describes a first stage of reconfiguration where connectivity is restored as soon as possible with the expense of some constraints (i.e. skipping non-essential steps)); and

performing said request in a second consolidation phase comprising said previously skipped security related configuration steps. ([0035] describes a second stage of reconfiguration where the full constraints are fulfilled.)

Regarding claim 5, Dang discloses:

A network element of a transport network ([0022] lines 1-2, "a network node"), comprising:

a number of input and output ports (See Fig. 6, User Cards 86, 88, and Network Cards 90 and 92),

a cross-connection matrix for randomly establishing connections from any to an port (see Fig. 6 Switching Fabric 82) and

at least one controller (see Fig. 6 connection manager 84) for configuring said network element and establishing cross-connections through said matrix;

said controller being adapted to perform a received configuration request in a fetch-ahead phase first and to perform said request in a consolidation phase thereafter;

wherein said fetch-ahead phase comprises only configuration steps essential for fast implementation of said cross-connection and skipping security related configuration steps thereby providing reduced security against process restarts ([0034] describes a first stage of reconfiguration

where connectivity is restored as soon as possible with the expense of some constraints (i.e. skipping non-essential steps)); and
wherein said consolidation request comprises said previously skipped security related configuration steps. ([0035] describes a second stage of reconfiguration where the full constraints are fulfilled.)

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 2 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dang as applied to claims 1 and 5 above, and further in view of Ardis et al. (US 6591373), hereafter Ardis.

Regarding claims 2 and 7, Dang discloses:

Said consolidation phase comprising: storing of the configuration changes in a persistent local database. (it is inherent that in switching from the path established in the first phase to the path established in the second phase that the second phase's result must be stored in a persistent database.)

Dang discloses all the limitations of claims 2 and 7 except that said consolidation phase comprises a consistency check of said request.

The general concept of performing a consistency check of a request is well known in the art as taught by Ardis (See Ardis, Col 31, lines 44-64 and Fig. 2.)

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the second phase of Dang with the general concept of performing a consistency check of a request as taught by Ardis in order to "consistently control the configuration of a system". (Ardis, Col 2, Lines 24-27)

5. Claims 3, 4, 8 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dang as applied to claims 1 and 5 above, and further in view of Legge ("Change your screen resolution: it could be a whole new ballgame").

Regarding claims 4 and 9,

Dang discloses all the limitations of claims 4 and 9 except for a timer is started during said fetch- ahead phase and if said timer lapses before said consolidation phase has been completed, configuration steps performed during fetch-ahead are undone by re-loading stored configuration data.

The general concept of having a timer during reconfiguration is well known in the art as taught by Legge (After a new resolution is applied (i.e. fetch-ahead) a 15 second timer is started, which waits for a user to confirm the resolution change, which after it expires the screen is returned to its previously configured resolution.).

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the method and system of Dang with the general concept of of having a timer during reconfiguration as taught by Legge in order to ensure a known working configuration is active.

Regarding claims 3 and 8,

Dang discloses all the limitations of claims 3 and 8 except for execution of said request in the fetch-ahead phase leads to an inconsistency between actual hardware configuration and locally stored configuration data of said network element and wherein during said consolidation phase, said inconsistency is resolved.

The general concept of an inconsistency that appears during a test phase being resolved during a consolidation phase is well known in the art as taught by Legge (note "Should your screen go blank or appear to go wild" is a hardware inconsistency with the local configuration data, and that if during the phase where the system is waiting for a user response the user can choose not to respond and the system will return to a configuration state that is consistent with the video display hardware.)

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Dang with the general concept of an inconsistency that appears during a test phase being resolved during a consolidation phase as taught by Legge in order to ensure a known working configuration is active.

6. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Dang as applied to claim 5 above, and further in view of Jakel et al. (CA 02272425), hereafter Jakel and Haakana et al.(US 6801774), hereafter Haakana.

Dang discloses all the limitations of claim 6 except for

wherein said controller comprises a layered control software with at least two software layers,

a first software layer comprising an abstraction of physical and logical resources of said network element for the purpose of network management and

a second software layer comprises a representation of the actual hardware modules of the network element and its configuration, each of said software layers comprising a individual persistent storage storing an image of configuration data of the corresponding software layer;

said controller being adapted to successively process said request in each of said layers and forward it to the next lower layer,

wherein storing of configuration data to the persistent storage is performed in each of said layers during consolidation phase, only.

Jakel teaches:

wherein said controller comprises a layered control software with at least two software layers, (note Fig 1 which teaches multiple layers of software Layer1-Layer4)

a first software layer comprising an abstraction of physical and logical resources of said network element for the purpose of network management (page 7 lines 4-8 describe the MIB which is an abstraction of physical and logical resources) and

a second software layer comprises a representation of the actual hardware modules of the network element and its configuration, (lines 11-

Art Unit: 2154

4 describe a firmware layer that knows the actual state of the hardware modules.)

each of said software layers comprising a individual persistent storage storing an image of configuration data of the corresponding software layer; (note Fig. 1 where each layer has attached storage DB1-4) said controller being adapted to successively process said request in each of said layers and forward it to the next lower layer, (note page 9, Steps S1-S5 describe the process of processing and storing the request through each layer)

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the network node of Dang with the layered software system of Jakel in order to improve the availability, robustness and survivability of a system. (Jakel, page 3, lines 27-30)

The general concept of waiting until a connection is fully secure and tested before writing configuration information to a database is well known in the art as taught by Haakana (Col 5, lines 38-63, where the network element is only recorded into the network management system after all testing and connection is complete).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Dang and Jakel with the general concept of waiting until a connection is fully secure and tested before writing configuration information to a database as taught by Haakana in order to reduce configuration errors.

Response to Arguments

7. Applicant's arguments filed 5/14/2007 have been fully considered but they are not persuasive.

Summary of Applicant's Arguments

- 1) Applicant argues that the objection to Oath/Declaration be withdrawn.
- 2) Applicant argues that the objections to the specification be withdrawn.
- 3) Applicant argues that the objections to the claims be withdrawn.
- 4) Applicant argues that the rejection of claims 1 and 5 under 35 U.S.C. 102(e) over Dang should be withdrawn because Dang does not disclose a new cross-connection through a network element and that Dang discloses multiple configuration requests instead of a single request performed over two phases.

Response to Applicant's Arguments

- 1) The objection to the Oath/Declaration has been withdrawn therefore Applicant's arguments are moot.
- 2) The objections to the specification have been withdrawn therefore Applicant's arguments are moot.
- 3) The objections to the claims have been withdrawn therefore Applicant's arguments are moot.
- 4) Dang discloses a new cross-connection through a network element, because when reconfiguring a network it is inherent that each network element must also have a new cross-connection. In addition, the "fast link state announcement" implements the

new cross-connection because in order for the connection re-routing to occur the head-end node must first receive the "fast link state announcement".

In response to applicant's argument regarding that Dang does not disclose a single configuration request that is performed in two phases, the Examiner notes that there is only one fast link state announcement that initiates the new cross-connection through the network elements in Dang; and then there are two phases in order to restore the connection.

In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., "The cross connection, once established in the first phase does not change during the second phase.") are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

Conclusion

8. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Art Unit: 2154

the advisory action. In no event, however, will the statutory period for reply be less than SIX MONTHS from the mailing date of this final action.

NATHAN J. FLYNN
ADVISORY PATENT EXAMINER
